LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

AUSTRALIAN MUSEUM.

(REPORT OF THE TRUSTEES FOR THE YEAR ENDED 30TH JUNE, 1913.)

[In substitution of Paper laid upon Table on 12th August, 1913.]

Presented to Parliament pursuant to Act Mo. 61, 1902, sec. 10

Printed under No. 5 Report from Printing Committee, 18 September, 1913.

To His Excellency the Governor,-

The Trustees of the Australian Museum have the honor to submit to your Excellency their Fifty-ninth Report, being for the year ended 30th June, 1913.

1. TRUSTEES.

We have to report with much sorrow the death, in September, 1912, of Dr. James C. Cox, who had been a Trustee for forty-seven years. He joined the Board of Trustees in 1865, was appointed Crown Trustee in succession to the late Rt. Hon. Sir Alfred Stephen, G.C.M.G., in 1890, and was elected President by the Trustees in 1892, to which position he was re-elected each year afterwards until his death.

It will be of interest to record the names of those who have held the office of Crown Trustee since the incorporation of the Museum under Trustees in 1853:—

1853-1856-Hon. Sir Henry W. Parker, Premier and Colonial Treasurer.

1856-1879—Hon. Sir Ed. Deas-Thomson, President of the Legislative Council.

1880-1889—Rt. Hon. Sir Alfred Stephen, Chief Justice and Lieut.-Governor.

1890-1912—Dr. James C. Cox, Senior Trustee at time of appointment.

In accordance with the Consolidated Act of Incorporation, the following additional Official Trustees have been appointed by His Excellency the Governor:—

The Hon. Minister for Public Instruction.

The Surveyor-General and Chief Surveyor.

The Director-General of Public Works.

The President of the Legislative Council.

The Crown Solicitor.

Changes among the Elective Trustees have been :-

Mr. Henry Deane had leave of absence during a great part of the year on account of his frequent absences in connection with his duties on the Transcontinental Railway, and he resigned his seat in November, 1912. The Hon. F. E. Winchcombe, M.L.C., was elected to the vacant position in February, 1913. On account of the appointment of Mr. H. H. B. Bradley to be Crown Trustee another vacancy has occurred among the elective Trustees, and Jas. R. M. Robertson, Esq., M.D., C.M., has been nominated for the position.*

Mr. H. B. Bradley was elected President, in succession to the late Dr. J. C. Cox, for the remainder of the year 1912, and was re-elected for the year 1913. Although this office was held by the late Dr. Cox, and is now held by Mr. Bradley simultaneously with that of Crown Trustee the two are not dependent one on the other. The former is an annual election by the Trustees, the latter an appointment by the Governor.

Leave of absence was granted during part of the year to Surg.-Gen. W. D. C. Williams, C.B., and to Prof. J. T. Wilson, M.B., Ch.M. Prof. Wilson is absent on a visit to Europe, and the opportunity was taken to request him to represent the Trustees on various Scientific Congresses to be held in Europe and America, should opportunity offer.

ATTENDANCE OF THE TRUSTEES DURING 1912.

The following is a list of the Trustees, with records of their attendances at Board Meetings during the year 1912.

During the year 1912 there were eleven ordinary meetings of the full Board of Trustees.

(a) Had leave of absence granted during the year.

2. FINANCE.

The Museum is supported financially by the Government of New South Wales, partly by an endowment of £1,000 provided by the Act of Incorporation, and partly by Parliamentary appropriations, varying from year to year to meet requirements.

3. STAFF.

The changes among the members of the staff were:—Mr. H. S. Grant, Assistant to the Taxidermist, was appointed to the new office of Collector, with the intention of sending him, as opportunity offers, on collecting expeditions. Mr. Henry Barnes, Articulator, died on 29th April, 1913, after a connection with the Museum in various capacities of thirty-four years. The vacancy was filled by the promotion of Mr. Chas. Clutton, Assistant, to the position. Applications were advertised for to fill the vacancy caused by the promotion, but up to 30th June no appointment had been made. Mr. A. Smith, Clerk, was promoted to be a Cadet, but afterwards resigned his connection with the Museum, and the vacancy so caused was filled by the appointment of Mr. Wilfrid Vaughan to be Library Clerk, and of Mr. James A. Trimble, one of the Attendants, who had been assisting in the office for some time, to be Clerk. Mr. E. Le G. Troughton was also promoted from Cadet to be a Junior Assistant.

As mentioned in last report, Mr. Chas. Hedley, Assistant Curator, was instructed to visit certain Museums in America during his leave of absence, and at the time of writing was still away on that leave. He has since returned and handed in a report of his visits, which has been printed, and forms, in the Museum Series, Miscellaneous Papers, No. VIII.

4. VISITORS.

The Museum continued open throughout the year, during the usual hours, viz., on week-days (Mondays excepted) 10 a.m. to 5 p.m., and on Sundays from 2 to 5 p.m. The number of visitors recorded on week-days was 161,557, averaging 609, and on Sundays 60,726, averaging 1,176 per day, making a total of 222,283. On Mondays, except when a public holiday falls on that day, the Museum is closed for cleaning; but in the afternoon students and pupils of public and private schools, with their teachers, are admitted, and are given facilities for study and tuition.

These figures show a steady increase year by year, but the facilities offered for students and schools on Monday afternoons are not taken advantage of as fully as the Trustees hoped they would be. It is noticed, however, that a number of school children come on ordinary visiting days with their teachers, but then they cannot receive the special attention that may be given them on Mondays. Details of the attendances are given below.

5. Lectures.

The Lectures on Thursday evenings were regularly given during the winter months of the year. The attendance at times overtaxed the seating capacity of the Lecture Hall, and it is possible that ere long the lectures will be given more frequently than once a month. The Syllabus during 1912–1913 was:—

July 18-"The Struggle for Existence," Mr. W. J. Rainbow,

Aug. 15-" Meteori es," Dr. C. Anderson.

Sept. 19-"Some Parasitic Plants: Entomogenous Fungi," Mr. W. J. Rainbow.

Oct. 17-"Some Evidences of Evolution," Mr. E. F. Hallmann.

Nov. 21-" Rock Crystal and its Allies: their Structure and Uses," Dr. C. Anderson.

April 10-"The Sword," Lieut, Colonel Reuter E. Roth, D.S.O., M.R.C.S.

May 8-"The Story of a Cocoanut," Mr. C. Hedley.

June 12-" Foods, Medicines, and Charms of Savage Man," Mr. W. J. Rainbow.

A summary of these lectures is given in the following paragraphs:-

1912 Course.

In dealing with the subject of "The Struggle for Existence, or Natural Selection," on Thursday, 18th July, Mr. W. J. Rainbow said, that it is necessary to consider two main factors, viz, Colouration and Formation, and to divide these into two classes.

Thus, for convenience, we find there are:—(I) Colouration; (1) protective colours; (2) warning colours (a) of creatures specially protected, (b) of defenceless creatures mimicking a; (3) alluring colours. (II) Formation: (1) protective forms; (2) aggressive forms.

In life, and in the midst of natural surroundings, the colours of animals serve as protection or warning; protective colouration is exceedingly prevalent in nature. The white of Arctic animals, the sandy colours of the inhabitants of the deserts, the spots of the leopard, and the stripes of the tiger and zebra, are all highly protective, and therefore in each case beneficial to the individual.

Amongst birds, reptiles, and insects the same phenomena prevail. In each of these groups many of the species are protected by various tints of greens, greys, browns, and yellows, and so closely do they harmonise with their surroundings that frequently, unless detected in actual motion, it is not easy to distinguish them.

In illustration of protective colouration, a number of insects that simulate green and dead leaves were mentioned. These insects include grasshoppers, locusts, butterflies, and moths.

Insects afford, as usual, the most numerous examples of "warning colours," which are always bright and distinct, and the animals endowed with them are bold and leisurely in their movements. They have little to fear, because, being possessed of objectionable characters, such as offensive odours or pungent acrid juices, they are not likely to fall as prey. Warning colours are not only protective to the animals possessing them, but a clear intimation to those of carnivorous habits that such creatures are dangerous and had better be left alone.

Among butterflies there are several families, comprising hundreds of species, and inhabiting the warmer portions of the globe, which are not only bright, but are usually large. Yet, despite these prominent features, they are almost totally immune from attack. A common local example is that of the "Wanderer" butterfly, a species that has followed the milkweed (known to botanists as Asclepsia) all over the world.

Uneatable insects are frequently mimicked by those of an edible nature. Edible butterflies mimic inedible forms; edible moths mimic inedible butterflies; some soft-bodied beetles simulate in general appearance hard-bodied beetles, and so on. Then again some potently armed and aggressive insects, such as wasps, hornets, and ants have many imitators. Of these, the wasps and hornets are mimicked by beetles; whilst ants are mimicked by beetles and spiders. Those species that are mimicked are in some way disagreeable, or even dangerous, to enemies of their class, and this being so, the only conclusion that can satisfactorily explain the phenomena of mimicry is that natural selection has produced the modifications, and is responsible for the results. An illustration of "alluring colouration" is an Indian mantis that attracts insects upon which it feeds, by its flower-like shape and pink colour, the supposed petals being the flattened legs of the insect. In illustration of "protective formation" stick caterpillars, excreta-mimicking spiders, spiny spiders, and hairy caterpillars were referred to.

"Terrifying mimicry" next received attention. Another remarkable method of seeking protection adopted by some caterpillars is malingering. Those that have acquired this habit pretend they have been stung by a wasp by displaying, when such an enemy is hovering about, discoloured patches on parts of their bodies.

Summing up the facts, the lecturer submitted the following conclusions:-

- 1. Colour, as such, is of no value to an animal living in a state of nature, whether vertebrate or invertebrate, unless it is of use to it, either as a means of protection or in assisting it to capture prev.
- 2. All colours were originally non-significant, but during the course of many ages both colour and form have been modified, and are now of the highest possible value.
- 3. Colour and form are not absolutely stationary, but, just as in generations past animals and plants were subject to variations, even so there are now being perfected modifications of the highest functional importance; but these changes are, of necessity, gradual.
- 4. So long as a certain colour, tint, or form is of value to an animal, so long will it or they be retained; but the instant they become useless or harmful, other modifications will begin to assert themselves, and the latter, though of necessity slow, are more rapid among invertebrate forms.

In his lecture on "Meteorites" delivered on Thursday, 15th August, Dr. Chas. Anderson explained that the earth, in its passage through space, annually encounters millions of cosmic bodies. These bodies are mostly of small size, and become dissipated in the upper atmosphere, but occasionally they survive and reach the earth as meteorites. Meteorites were then described, their chemical and physical properties outlined, and a short summary of the growth of our knowledge of meteorites given. Speaking of the origin and the original home of meteorites, Dr. Anderson stated that we have no certain knowledge, but that, reasoning from circumstantial evidence, we are led to believe that shooting stars, comets, and meteorites are closely connected, if not identical.

In the next lecture, 19th September, "Some Parasitic Plants: Entomogenous Fungi," by Mr W. J. Rainbow, were dealt with.

Entomogenous fungi are a group of parasitic cryptogamic plants which live upon, and at the expense of, various insects. The subject was one that was interesting both to the botanist and entomologist, since it dealt with a group of cryptogamic plants, parasitic on insects. "Vegetable caterpillars," so-called, were, of course, the most familiar objects of this side of nature-study, if we except "foul brood" the dreaded scourge of the beehive. Numerous insects are, however, attacked by entomogenous fungi, such as beetles, moths, butterflies, caterpillars, locusts, grasshoppers, wasps, ants, bugs, cicadas, flies, and spiders. In the Murrumbidgee form, Cordyceps taylori the insect in some specimens is six inches long, and the plant about the same. But the latter differs from the New Zealand form, C. robertsii, and an Australian form, C. selkerkii; so much so, that it is impossible to mistake it. The two latter have a bulrush-like process proceeding from the back of the neck, whilst the first-named has a thick stem formed by the close union of several stalks, which, uniting at the top, are surrounded by a fringe, and when expanded this assumes the appearance of a full-blown flower upon the surface of the soil. This fringe is of a brown colour, and of a velvety texture. Another is C. gunni, which is generally found under wattles or gums, immediately after the first autumnal rains (about March). The fungus, with one to five stems, but generally with one only, usually shoots from the nape of the neck and tail. The chrysalis is found, too, with one stem from the upper part, and sometimes also encircled with rings of fungus. Wonderful stories were invented and related as to the origin and development of the "Vegetable caterpillar."

Speaking of the New Zealand species (S. robertsii), a writer in the "Scientific American" said:—" It is certain that the caterpillar and fungus were made for each other, as Hepialis virescens (the caterpillar) is never found without Sph ia (Cordyceps) robertsii growing out of it, and Spharia robertsii is never found without this caterpillar with it." Truly a marvellous conclusion; for, in the first place, the caterpillar referred to is that of a wood-boring species, and as such is immune from the attacks of Cordyceps, for the simple reason that the latter cannot develop and grow in the burrow made by a caterpillar in the trunk of a tree, that being the place where Hepialis feeds, grows, and pupates; in the second place those caterpillars that are affected burrow in the soil. This particular Cordyceps needs a caterpillar upon which to develop, but when it appears upon such a host it kills it. Another ridiculous story in respect of C. robertsii was that the caterpillar swallowed the seeds of the rata-tree (Metrosideros robusta); that they then germinate, kill the caterpillar, and grow in the ordinary way.

A Chinese species (C. sinensis) was used for medicinal purposes, but only in the Emperor's palace, as a strengthening and renovating substance. A duck was stuffed with five drachms of the fungus, and the bird roasted by a slow fire. The virtue of the fungus was supposed to pass into the bird, the flesh of which must be eaten twice daily for eight or ten days. In New Zealand the Cordyceps was, in times gone by, used by the Maoris as a pigment in tattooing.

Entomogenous fungi have not so far been found upon the larvæ or pupæ of hawk-moths, notwithstanding the fact that these insects pupate in the soil. These fungi never shrivel, or in any way distort the bodies of their victims—not even the soft-bodied caterpilars: they are always of natural proportions, with every characteristic wrinkle and fold of the skin preserved.

On 17th October, in "Some Evidences of Evolution," Mr. E. F. Hallmann confined his remarks to the evolution of living things, particularly of animals, a phase which in the present day is known as "organic evolution." The lecturer traced the evolution of animals from the very earliest periods in history to the present day. He paid special attention to anatomy and geology, the last-mentioned being of infinite assistance in determining the age at which the animals frequented the earth, as indicated by the fossil remains in sedimentary rocks. He mentioned the features responsible for the evolution, laying stress upon geographical distribution; and, in addition, dealt briefly with paleentology and embryology. To lend additional interest to his remarks, the lecturer had numerous skeletons on view, which he minutely explained.

The lecture on 21st November, was entitled "Rock Crystal and its Allies: their Structure and Uses," by Dr. Chas. Anderson. The minerals belonging to the quartz group are exceedingly common, and very diverse in form and appearance. Chemically, they are composed of silica, and within the group we find minerals clear and colourless as glass; others opaque and almost as black as jet, and still others which are red, orange, green, violet, or blue. There is crystallised quartz, comprising the transparent colourless variety known as rock crystal, the violet-coloured amethyst, smoky quartz or cairngorm, rose quartz, cat's eye, and tiger's eye quartz, &c. Then the compact varieties: jasper, chrysoprase, and flint, which are aggregates of quartz crystals. The crypto-crystalline varieties, in which the structure is fibrous and minutely or obscurely crystalline, comprising chalcedony, agate, cornelian, &c. The fourth group consists of varieties in which silica is combined with a certain amount of water, and in which there is no trace of crystalline structure, such as opal and siliceous sinter, the siliceous deposit from hot springs.

Although not strictly a gem-stone, quartz has been extensively and universally used for ornamental purposes, and in all ages. In the time of the Roman Emperors, bowls, vases, and goblets were carved out of rock crystal. Still earlier it was used by the Egyptians and Assyrians for the making of beads, seals, necklaces, &c. Now it has various technical applications, as in the manufacture of lenses for spectacles and telescopes of standard weights, where great accuracy is required, and of apparatus used in the circuital laboratory.

The most important of the crypto-crystalline varieties is agate, than which no stone is applied to so many diverse purposes. It is used for making various articles of adornment, as buttons, sleeve-links, pendants, hair-pins, for stick and umbrella handles, children's marbles, match-boxes, penholders, chessmen, candlesticks, &c.

The cutting and polishing of agate, which is essentially a German industry, is carried on mainly at Oberstein and Idar.

Opal is the most important of the hydrous silicas. Common opal showing no fire or play of colours is widely diffused, but the beautiful precious, or noble, is comparatively rare. Until recent years Hungary was the only source of opal; now New South Wales and Queensland supply the world's demand, but it has also been found to a limited extent in Mexico and Central America.

1913

1913 Course.

This course of lectures was opened on 10th April, by Lieutenant-Colonel Reuter E. Roth, D.S.O., M.R.C.S., who lectured on "The Sword." The History of the Sword is the History of Humanity, and during the Knightly Ages the good Sword of the Paladin and the Chevalier embodied a new faith—the Religion of Honor.

Many of our present-day courtesies are the lingering embers of early instincts. Primitive man knew that his very existence depended on the strength and number of his tribe. It was therefore his first care to protect the women and children. This instinct to give way to women, children, and the weak still exists amongst men.

The lower animals are born armed, whilst man has to weapon himself. His teeth and nails are not strong enough. His first weapons were probably stones used as missiles. To use his weapons correctly he stood up on his feet, whilst the weak and young would crouch for shelter. This may have given rise to the instinct of giving up one's seat to the weak and old.

The history of the sword can be divided into four periods: the period of the sword, the rapier, the transition period, and the age of the sabre and the small sword.

The earliest swords were made of wood and bone, teeth of animals, stone, copper, bronze, iron, and, last of all, steel. The earlier swords had a plain cross-guard; for this reason they were looked upon as the emblem of the crucifix, and were kissed before use. The "recover" reminds us of this act. In saluting with the sword, we have the movements of wafting a kiss, as was done to one's ladylove before entering upon the jousts. When the soldier lay dying, the reversed sword was brought to his lips. This is probably the origin of the "reversed" arms at military funerals.

The sword being carried on the left side, the right arm was offered to the "lady fair," a custom which still holds amongst British people.

In walking along the narrow streets in former ages one kept to the right, to leave the left hand holding the buckler free for defence and the sword-arm free for offence. Mounted, the knight kept to the left or near side, so that in meeting it would be sword-arm to sword-arm, and there would be less risk of hitting the horse's head. These rules of the road still remain.

Every old sword, besides its beauty and picturesqueness, represents an amount of serious thought and ingenuity which in our days would be considered quite wasted on such an object. But this is merely so because the age of carrying the sword belongs to history.

The second lecture of this course was delivered on 8th May, by Mr. Charles Hedley. The subject was "The Story of a Coconut." Its admirers claim for the ecconut that it has more and varied uses than any other plant in the world. It gives not only milk, but drink, clothes, weapons, and even houses. The milk possesses a peculiar flavour of its own, but it has neither the appearance of milk nor the taste; in fact, it resembles soda-water, and the taste is not unlike ginger-beer. In the greater portion of the Coral Islands water is scarce, and it is not surprising, therefore, that the natives look upon the coconut milk as their staple liquid refreshment. The juice is drunk only from the green fruit.

Inside the coconut shell is the kernel, and this is the most important part of the fruit. It is largely used as a food, and when baked makes a very nice dish. The method usually employed to cook this food, is to first scrape the kernel into flakes, and to then bake them.

The oil, which is obtained from the coconut palm, gives to it its great commercial value, and was formerly sent to Sydney in bulk, but now the kernel is dried and the product, which is known as copra, is shipped in that fashion. Copra when it goes to the mill is crushed and ground, and then put under a hydraulic ram, which squeezes out the oil, and the resultant article is known as oil-cake, used largely as a food for cattle. Coconut oil is sold largely in Germany to the poorer classes, as an excellent substitute for butter. In taste and appearance it is not unlike the genuine article, and is considered to be very wholesome. In addition to the above, copra is used largely in the manufacture of soaps.

Outside and surrounding the kernel is the shell, which is only a quarter the thickness of the kernel. It is hard, black and waterproof, and largely employed in the manufacture of drinking vessels. The kernel is got rid of without breaking open the shell by knocking holes in the "monkey's eyes," the only soft portions of the shell, and then by soaking the latter in water. After the lapse of a few weeks the kernel would rot and could easily be got out. The "monkey eyes," the peculiar markings on the coconut, are left by nature for the palm to put out its root and stalk.

Several coconuts were exhibited, showing how the husk—the outside covering—had grown to a point. The virtue of this was that when the nut was dropped from a height, the fruit would be made to fall on this point, and would not suffer in any way. When the husk is soaked in water, the fibres separate and become a mass of threads, which are then made by the natives into ropes of different patterns, and are plaited for various uses, with special names for them. White sailors use "coir" made from the husk as mooring ropes. Boxing gloves and sandals are also made from the coconut husk. A complete suit of armour is made by the Gilbert Islanders from the same husk, and is used by them when they decide to settle personal differences by the aid of a long spear made from the stem of the coconut palm, with shark's teeth lashed to the blade.

The leaves are almost indispensable to the natives. Baskets for carrying their food are often made from the leaves, and torches as an aid to fishing are manufactured from the same material. A large number of the native huts are formed of the leaves.

The tree is also largely used. It is an excellent wood, and can be highly finished. The palm has a great spread of leaves, and will catch almost as much water as a house. This fact is not lost sight of by the natives, who divert the course of the water so that it trickles into clam shells, held ready for its reception. Native dresses are manufactured from the leaves of the coconut palm.

The origin of the coconut palm has been the source of a great deal of argument. Many say it is a native of South America. There is some ground for this contention, as the seventeen other trees that have the same surname as the coconut are natives of South America. On the other hand there are records in Ceylon literature that it grew in that country even 1,000 years ago. It is probable, however, that the Polynesians, whose feats of navigation are well known, might have crossed to South America, and so secured specimens of the plant.

On 12th June, Mr. W. J. Rainbow lectured on "Foods, Medicines, and Charms of Savage Man," from the entomological side of the subject. The word "insect" would, however, be applied in its widest form, so as to include scorpions, spiders, and centipedes, which, strictly speaking, were not insects at all. The natives of New Caledonia collected and ate numbers of orb-weaving spiders, and one species had been named Araneus edulis in consequence. In respect of civilised man, we had it on the authority of the learned Reaumer, and Latreille, that educated people of their acquaintance had eaten spiders. Reaumer had recorded the fact that a young lady of his acquaintance never saw a spider in her garden that she did not eat there and then; while according to Latreille, the famous French astronomer of his day, La Lande, used to spread them on his bread like butter, and eat them with relish. The famous Anna Maria Shurmann was also very fond of eating spiders. Wood-boring grubs or beetles and moths enter largely into the dietary of our Australian blacks, being sometimes cooked and sometimes eaten raw, and here again, civilised man has also utilised these creatures as food. In Ancient Rome, epicures were very fond of roast or baked larvae, and these delicacies always found a place upon their tables, both in their homes and at their feasts. There seems to be little, if anything at all, to be said against these insects as food, save prejudice, because they live in clean surroundings, and subsist upon clean food. The question in respect of any species of animal, when it is to be applied for food, is whether it contains those chemical properties that are essential in foods, and in what proportions. These larvae do not seem to have been so treated, but they nevertheless appear to be very nutritious. Other insects eaten by savage and civilised man are locusts and grasshoppers. In Australia our aborigines eat them, and this remark applies to natives of New Caledonia and Africa, as well as peasants in the Crimea. Ants, bees (as well as their honey), wasps, white ants, moths, and flies also contribute to the food supply of various races of savages. Among civilised people, spiders and scorpions have been used as medicines, and several quaint practices were enumerated. Northern Queensland blacks use the green tree-ant, and the caterpillar and pupa of the butterfly, Liphyra brassoilis, found in the nest of the latter, as a medicine when anyone is unwell. In Brazil and Smyrna ants are used for the purpose of closing wounds. In Smyrna, this practice is followed by the barber surgeons. The wound is washed and cleaned, the lips brought together by the fingers of one hand, whilst the other, with the aid of a pair of forceps, applies a living ant, whereupon the insect buries its jaws in the wound, when the head is immediately cut off. In this way a dozen or more ant heads may be applied, and these are allowed to remain until the wound is sufficiently healed to allow of them being withdrawn.

The ornaments of savage man, in which insects or parts of insects were used in devices for personal adornment, were also described, as well as devices for charms toward evil spirits, and to keep mosquitoes away.

6. Acquisition.

The collections have been maintained in good order, but have not been added to so largely as in former years, partly from the want of exhibition space and partly from absence of storage accommodation.

A collector was appointed as foreshadowed in last report, but the Estimates were not passed by Parliament until December, 1912, and the appointment consequently was not made until the half year had elapsed. The remainder of the year was occupied in taxidermal work and collecting in the neighbourhood of Sydney. During the year 1913-14 he will go further afield.*

Among the most noticeable acquisitions during the past year were :—

Valuable Collections of Insects, including some co-types, by purchase.

Very interesting Minerals from various localities in New South Wales, partly by exchange and partly purchased.

Collection of Birds made by the late Mr. Geo. Masters, and another Collection made by a resident in the interior; both purchased.

Two North American Totem Poles from British Columbia, North America, by purchase.

(These valuable additions have been placed in Exhibition cases, one on each side of the Public Entrance. Accompanying this Report are photographs of these poles.)

Mediterranean Fishes, by exchange.

Meteorites and Minerals from North America, by exchange.

The Collections of Shells of the late President, Dr. Jas. C. Cox, partly by bequest and partly a donation by Dr. Arthur Cox, forming a very valuable addition to the Conchological Section.

The following return shows the number of specimens acquired during the year in each Section, and whether by Donation or otherwise.

RETURN of Specimens acquired during 1912.

7. Buildings.

The buildings have been maintained in good order. A few minor repairs have been carried out by the Trustees, or by the Department of Public Works. The renewals and repairs to roofs and gutters referred to in last year's report have been satisfactorily effected, and no further trouble has arisen from that source.

In regard to the further extension of the Museum, a deputation of the Trustees waited on the Hon, the Minister for Public Instruction, and in his unavoidable absence was received by the Under Secretary, to urge the provision of funds to commence this necessary and urgent work. The Museum is now so crowded that extension is urgent. The Library has over-run its bounds, and books are placed in corridors, workrooms, below-stairs rooms, and other unsuitable places; the exhibition space is full, and in places overcrowded, and the store-rooms for duplicate and unexhibited specimens are so crowded that space is not available to accommodate further specimens; in fact it has been found necessary to decline the acquisition of desirable collections for want of space to properly care for them.

8.

8. Exhibition Cases and Arrangement of Specimens.

During the year 1912-13 work under this heading was more of a completory than an initiatory nature, owing to the fact that want of space forbade any marked advance in the latter direction.

Glazed floor cases in the Main Hall were provided for the Indian and Sumatran Rhinoceri, and the Bison. At the north end of this hall there existed for many years a large table on which were exposed a series of mounted seals. This was abolished, and the animals provided with two large glazed floor cases separating them into "Eared" and "Earless" Seals. The acquisition of a fine Dugong in the flesh afforded an opportunity of displaying the animal correctly; this also was provided with a separate floor case.

There yet remains much to be done in encasing the larger animals in separate group cases. For instance, the Curator had projected a case for all the Bears, of which there are several very fine examples, and another for Foreign Seals, but the exhaustion of funds put a stop to this; at the same time the space is there awaiting these cases. Should funds be available it will be obligatory to similarly encase the larger Reptilia, such as the Crocodiles and Chelonians, now openly exposed in the centre of the Upper Main Hall.

In the Report for 1911-12 reference was made to the completion of the 4th Room of the South Wing, containing the Ethnological objects from the Bismarck Archipelago—with the exception of certain floor and interpillar cases. These are now erected and filled, so completing the room in question; the whole of the necessary printed labels have also been supplied. The Trustees again desire to call attention to the last paragraph but one under the heading "Exhibition Cases and Arrangement of Specimens" in their Report for 1911-12 (p. 6), wherein they refer to the fact that "no further progress at all can be made in displaying their rich stores of Ethnology from Pacific Islands" until a substantial addition is made to the Museum building.

The Trustees would earnestly commend to notice the two following axioms, penned by one of the greatest of Museum administrators, the late Dr. G. Brown Goode, M.A., of the Smithsonian Institution, Washington.

- 1. "A museum, to be useful and reputable, must be constantly engaged in aggressive work, either in education or investigation, or in both."
- 2. "A Finished Museum is a Dead Museum, and a Dead Museum is a Useless Museum."

9. Publications.

The issue of the Museum "Records" was confused and delayed by an unfortunate fire at the Printer's, but, notwithstanding, a number of papers have been published; these are:—

- "Records of the Australian Museum," Vol. VIII, No. 4, containing, Australian Tribal Names, with their Synonyms. By W. W. Thorpe. Title Page and Index to Vol. VIII.
- "Records of the Australian Museum," Vol. IX, No. 3, containing Studies in Australian Crustacea, No. 3. By A. R. McCulloch. Studies in Australian Fishes, No. 3. By A. R. McCulloch,

(The Index to Vol. IX is in preparation and will shortly be published, completing the volume.)

- "Records of the Australian Museum," Vol. X, Nos. 1, 2, 3, 4, 5, containing-
 - No. 1. Arachnida from the Solomon Islands. By W. J. Rainbow.
 - No. 2. On a Varanus and a Frog from Burnett River, Queensland, and a Revision of the Variations in *Limnodynastes dorsalis*, Gray. By Dene B. Fry.
 - No. 3. A very remarkable species of Spongophyllum from the Upper Silurian Rocks of New South Wales. By R. Etheridge, Jun.
 - No. 4. On the Early History of the Australian Cassowary (Casuarius australia, Wall). By Alfred J. North.
 - No. 5. Description and Analyses of the Binda Meteorite, by C. Anderson and J. C. H. Mingaye; and a Catalogue and Bibliography of Australian Meteorites, by C. Anderson.
 - "Australian Museum Memoir, IV." Scientific Results of the Trawling Expedition of H.M.C.S. "Thetis" off the Coast of New South Wales, Part 17, containing The Tunicata. By W. A. Herdman and Wm. Riddell.

(The Index to the "Thetis" publications is in preparation, and will shortly be issued, completing the volume.)

- Special Catalogue, "Nests and Eggs of Birds," by A. J. North, Vol. III, part 4, and Vol. IV, parts 1 and 2.
- Miscellaneous Papers, No. VIII, "Report on Museum Administration in the United States," by Chas. Hedley. This is a report issued as a result of Mr. Hedley's visit to America, as referred to in paragraph 3. It is not intended for general distribution, but is primarily for the information of the Trustees and Officers of the Museum.
- Miscellaneous Papers No. IX. Rules to be observed in Writing Papers for the "Records" or "Memoirs."
- A List of the Museum Publications to date is as follows:-

Publications of the Australian Museum.

I.—Catalogues.

- Catalogue of the Specimens of Natural History and Miscellaneous Curiosities in the Australian Museum, by G. Bennett. 1837.
 - 2. Catalogue of Mammalia in the Collection of the Australian Museum, by G. Krefft. 1864.
- 3. Catalogue of the Minerals and Rocks in the Collection of the Australian Museum, by G. Kreft. 1873.
- 4. Catalogue of the Australian Birds in the Australian Museum, by E. P. Ramsay. Part I, Accipotres; 1876. Part II, Striges; 1891. (Second edition, revised by A. J. North, 1898.) Part III, Psittaci; 1891. Part IV, Halcyones; 1894.
 - 5. Catalogue of the Australian Stalk and Sessil-eyed Crustacea, by W. A. Haswell. 1882.
 - 6. Catalogue of the Library of the Australian Museum. 1883. With two Supplements.
- Catalogue of a Collection of Fossils in the Australian Museum. With Introductory Notes, by
 Ratte, 1883.
 - 8. Catalogue of the Australian Hydroid Zoophytes, by W. M. Bale. 1884.
- 9. Descriptive Catalogue of the General Collection of Minerals in the Australian Museum, by F. Ratte. 1885.
- Catalogue of Echinodermata in the Australian Museum, by E. P. Ramsay. Part I. Echini,
 Second edition. 1890.
- Descriptive Catalogue of the Medusæ of the Australian Seas. Part I. Scyphomedusæ. Part
 Hydromedusæ. By R. von Lendenfeld. 1887.
- 12. Descriptive Catalogue of the Nests and Eggs of Birds found breeding in Australia and Tasmania, by A. J. North. 1889.
 - 13. Descriptive Catalogue of the Sponges of the Australian Museum, by R. von Lendenfeld. 1888.
- 14. Catalogue of the Fishes in the Australian Museum. Part I. Paleicthyan Fishes. By J. Douglas Ogilby. 1888.
- Catalogue of the Marine Shells of Australia and Tasmania, by J. Brazier. Part I. Cephalopoda;
 Part II. Pteropoda; 1892. Part III. Gasteropoda (Murex); 1893.
- Catalogue of Australian Mammals, with Introductory Notes on General Mammalogy, by J. Douglas Ogilby. 1892.
 - 17. Descriptive Catalogue of the Tunicata in the Australian Museum, by W. A. Herdman. 1899.

Special Catalogues.

 "Nests and Eggs of Birds found Breeding in Australia and Tasmania," by A. J. North. Vol. I, 1901-1904.
 Vol. II, 1906-1909.
 Vol. III, 1911-1913.
 Vol. IV, in preparation.

II.-Monographs.

1. "Australian Lepidoptera and their Transformations," by the late A. W. Scott, with Illustrations by his daughters, Mrs. Morgan and Mrs. Forde. Edited and revised by Mrs. Forde and A. S. Olliff. Vol. II.

III.-Memoirs.

- History and Description of the Skeleton of a new Sperm Whale in the Australian Museum, by W. S. Wall. 1851.
 - 2. Lord Howe Island: Its Zoology and Physical Characters. 1889.
- 3. The Atoll of Funafuti, Ellice Group: Its Zoology, Botany, and General Structure, based on Collections made by Mr. C. Hedley. 1896-1900.
- 4. Scientific Results of the Trawling Expedition of H.M.C.S. "Thetis," off the coast of New South Wales, in February and March, 1898-1913.

IV .- Guides.

- 1. Guide to the Australian Fossil Remains in the Australian Museum. 1870.
- 2. Guide to the Contents of the Australian Museum. 1883.
- 3. Guide to the Contents of the Australian Museum. 1890.

V.—Miscellaneous Publications.

- 1. List of old Documents and Relics in the Australian Museum. 1884. Reprinted, with additions, 1890.
- Descriptive List of Aboriginal Weapons, Implements, &c., from the Darling and Lachlan Rivers, by K. H. Bennett, F.L.S. 1887.
 - 3. Notes for Collectors. 1887.
 - 4. Hints for the Collectors of Geological and Mineralogical Specimens, by F. Ratte.
- Hints for the Preservation of Specimens of Natural History, by E. P. Ramsay. 1891.
 4th edition.
- List of Duplicate Books and Pamphlets, available for exchange, in the Library of the Australian Museum. Prepared by S. Sinclair, Secretary and Librarian. 1900.
- 7. Report of a Visit to certain European Museums in 1911, by Chas. Anderson, D.Sc., M.A., with notes by R. Etheridge, Curator. 1912.
 - 8. Report on Museum Administration in the United States, by Charles Hedley. 1913.
 - 9. Rules to be observed in writing papers for the "Records" and "Memoirs." Revised edition, 1912.

VI.—Records.

The Records contain descriptions of specimens, accounts of expeditions, and other results of the scientific work of the Museum Staff.

Vol. V.—1890-91. Vol. 11.—1892-96. Vol. III.—1897-1900. Vol. IV.—1901-1983. Vol. V.—1903-1906. Vol. VI.—1906-1908. Vol. VII.—1908-1910. Vol. VIII.—1912-1913. Vol. IX.—1912-1913. Vol. X. in course of publication.

10. LIBRARY.

The Library continues to be added to as the needs of the Museum require, but the congestion caused by want of adequate space for shelving the books militates very much against its efficiency.

The additions during the year, not counting unbound periodicals and pamphlets, were 453 volumes. The expenditure has been £484 11s. 2d.

A list of the additions to the Library will be found at the end of this report as Appendix II.

11. APPENDICES.

The following appendices are attached to this report, viz.:--

- I. Statement of Receipts and Expenditure.
- II, Catalogue of Additions to the Library.

The Common Seal of the Museum was hereunto fixed, by order of the Board, this twelfth day of August, 1913.

H. H. B. BRADLEY,

S. SINCLAIR,

Secretary.

President.

FORM OF BEQUEST FOR INSERTION IN WILLS.

І вериелтн	to the Trustees of the Australian Museum, free of succession duty and without deduction, the
sum of	pounds, and, or all my Library, Books, Natural History Specimens,
Geological S	Specimens, Ethnological Specimens,* to be applied by them for the benefit of the said Museum.
	clete the items not required.
Nor	m.—Wills containing these bequests must be executed in trict accordance with the law.

PORTION OF TOTEM-POLE, "HERALDIC" OR "ANCESTRAL" COLUMN.

SALISH INDIANS, CAPE MUDGE, GEORGIA STRAIT, BRITISH COLUMBIA.

Each Totem-pole tells some ancestral legend, and is practically the "badge" of a family or clan. They are seldom owned by an individual, but rather by a family or group. The carved figures may illustrate a legendary ancestral dream of exploit, which is the common property of the family, and is often believed to have been obtained by the said ancestor from the totem animal. Often the meaning of any given pole becomes complex, for marriages and important family records have been incorporated in additional carvings. These legends are in some cases but the traditions, folk-lore, and nursery tales of a primitive people.

These huge carvings, often from 50 to 60 feet high, are a conspicuous feature of any village on the North Pacific Coast of America, and many are so old that the Indians themselves have forgotten their meaning. They mark the area of the North Pacific Coast culture which extends from near Puget Sound along the coast to the Eskimo country in Southern Alaska. In some villages a pole stands in front of each dwelling. Totem-poles usually consist of cedar logs (in this case it is Oregon pine), as the local cedar forests are noted for their gigantic trees, the Indians being pre-eminently a wood-carving people. The carvings represent animals and birds, such as the bear, beaver, raven, frog, and fin-backed whale, also mythical monsters, the human face and figure. The art is symbolic and conventional, although rather realistic in appearance. The style of the Totem-pole varies more or less from tribe to tribe, and some are used as sepulchral receptacles, notably amongst the Haida and Tlingit Indians. They were usually erected during the great festivals commonly known as "Potlatches," a giving away of property as an investment, and for the purpose of gaining aristocratic position in the tribe.

On one of the poles is represented an eagle supported by a man, who is kneeling on a bear, between whose fore-paws is a human head reversed. The eagle, among the many birds held in superstitious and appreciative regard by the North American Indians, found an important place in their symbolic art. It was depicted on all their manufactures as well as on Totem-poles, House-and Grave-posts; many tribes even possessed eagle deities.
