

No. 45.

Locust.

Sydney 15 March 1839

v. note book. p. 25.

No 3 -  
H-

*Charocampa cinerea* ? ?

a lateral row of yellow spots common to  
 a Callistemon -  
 It hibernates in latter end of September - the outer  
 falling off the bush, & the larva being the size  
 of the mouth with silk, having a small circular  
 centre -

It has the head, part of thorax, & slight abdominal re-  
 but not covered with spines -

in November -

as drawn, having the  
 peris wings curled round -  
 it slightly retains, even  
 read out -

or oripator -

rest it does not hang, as  
 etc -
